FOREWORD

During 1998, 154 bibliographic items have been published, 19 among them in international scientific journals of highest rank, 1 in the book of an international publisher, 27 in national scientific journals, 3 in books reproducing invited lectures of international conferences, 79 as contributed papers of international and national conferences, and 15 in the IAU circulars. Five invited lectures and progress reports have been given by Observatory's fellows at international conferences and one at a national one. Four reviews and monographic texts have been published in national publications.

Numbers 157 and 158 of the Observatory's publication SERBIAN ASTRONOMICAL JOURNAL, as well as Nos. 59, 60, 61 and 62 of the PUBLICATIONS OF THE ASTRONOMICAL OBSERVATORY OF BELGRADE have been issued. These publications are regularly sent to 130 institutions and libraries in 43 countries and to 14 institutions and libraries within Yugoslavia.

Observatory's fellows have participated in works of 16 Scientific conferences abroad (28 participations by 19 fellows) and six conferences in Yugoslavia (61 participation by 28 fellows).

Organized by the Observatory were:

1. IV Yugoslav - Romanian Astronomical Meeting, Belgrade, 5-8.05.1998.
2. I Bulgarian - Serbian Astronomical Seminar, Belogradchik, 6-7.08.1998
3. II Yugoslav - Belarussian Symposium on Physics and Diagnostics of Laboratory and Astrophysical Plasmas, Zlatibor, 5-6.09.1998.

During 1998, Observatory's fellows have continued collaboration with their colleagues in Belarus, Belgium, Brazil, Bulgaria, Estonia, France, Greece, Holland, Hungary, Italy, Japan, New Zealand, North Ireland, Romania, Russia, Slovakia, Spain, Turkey, Ukraina, USA and Uzbekistan. In the bilateral protocol between Yugoslav and Italian governments on scientific collaboration, a project on collaboration between Belgrade Astronomical Observatory (Z. Knežević in charge) and Università di Pisa (A. Milani in charge), is included.

Besides numerous newspaper articles and radio and TV emissions Observatory's fellows authored, they gave 32 lectures on astronomical subjects outside our institution contributing to the cultural life in our country. Moreover 16 lectures have been given at the Astronomical Observatory itself.

As from 1998 Astronomical Observatory has an internet connection available from each personal computer at the Observatory with Windows 95 installed. I would like to indicate likewise that Serbian Astronomical Journal is available on www through the Astrophysical Data System (ADS), thanks to the courtesy of the System's holders. 1. SOME OF THE MAIN RESULTS OF THE OBSERVATORY'S RESEARCH ACTIVITY

Considering that the essential contributions to the science of fellows of the Belgrade Observatory are those published in international journals, a review of just such achievements should be of particular interest to the astronomical community. The results of observational programmes and review articles appeared in books of international character will be mentioned as well.

Georgije Popović in collaboration with T. A. Agekyan and A. Yu. Mel'nikhnikova from the Astronomical Observatory of the St. Petersburg State University, applied a method based on data for stars with large proper motions to determine coordinates of the Solar apex relative to stars of various spectral types. The obtained results show that the velocity centroids for stars of different spectral types are different. According to the values $\ell = 44^\circ 0$ and $b = 7^\circ 0$ obtained using all stars, the Sun is currently approaching the Galactic center and moving away from its symmetry plane, the Sun being located above this plane.

Slobodan Jankov in collaboration with S. V. Beredyugina, I. Ilyin and I. Tuominen from University of Oulu in Finland and with F. C. Fekel from Tennessee State University in Nashville (USA) investigated stellar and orbital parameters of the active RS Canum Venaticorum binary II Pegasi (Beredyugina *et al.* 1998). A detailed model atmosphere analysis of high resolution and high S/N CCD spectra of II Peg has yielded for the first time a self - consistent set of fundamental parameters of the primary component, among them: $T_{eff} = 4600$ K and $\log g = 3.2$. In addition, 121 new high quality radial velocity measurements allowed authors to determine improved orbital parameters, resulting in a new orbital ephemeris of $T_{conj} = 2449582.9268 + 6.724333E$. The position of the primary of II Peg in the HR diagram with the new parameters corresponds to a K2 IV star with mass of 0.8 Solar masses. Combining all parameters, the radius of the primary is estimated as 3.4 Solar radii and the inclination as 60° , with the assumption that its rotational axis is perpendicular to the orbital plane. Jankov and colleagues conclude that the secondary is probably a M0-M3 V star with a mass of about 0.4 Solar masses.

During 1998, Milan S. Dimitrijević and Luka Č. Popović in collaboration with Sylvie Sahal - Bréchot, continued their efforts to provide to scientific community an as much as possible complete set of reliable Stark broadening data for spectral lines of interest for analysis and modeling of stellar plasma, for stellar opacity calculations, abundance determinations, investigations of subphotospheric layers and other astrophysical problems. The results obtained within the frame of common project with S.

Sahal - Bréchot, as well as the future plans, have been reviewed by Dimitrijević (1998). During the considered period, Dimitrijević and Sahal - Bréchot applied semiclassical perturbation method for the analysis of Stark broadening of spectral lines within spectra of S V (Dimitrijević and Sahal - Bréchot 1998a), V V and V XIII (Dimitrijević and Sahal - Bréchot 1998b), Ca IX and Ca X (Dimitrijević and Sahal - Bréchot 1998c), Si XI and Si XIII (Dimitrijević and Sahal - Bréchot 1998d), Mg II (Dimitrijević and Sahal - Bréchot 1998e), Na X (Dimitrijević and Sahal - Bréchot 1998f), O VII and Mg XI (Dimitrijević and Sahal - Bréchot 1998g), Sc X, Sc XI, Ti XI and Ti XII (Dimitrijević and Sahal - Bréchot 1998h), and Y III (Dimitrijević and Sahal - Bréchot 1998).

When it was not possible to use the semiclassical perturbation approach with the appropriate accuracy due to the lack of reliable atomic data, the modified semiempirical method of Dimitrijević and Konjević has been applied by Luka Č. Popović and Milan S. Dimitrijević (1998ab), for the analysis of Stark broadening within spectra of Kr II (Popović and Dimitrijević 1998a), Mn II, Mn III, Ga III, Ge III and Ge IV (Popović and Dimitrijević 1998b). In all cases, analysis has been performed with the particular emphasis on the astrophysical implications for stellar plasma analysis.

Such data are of interest not only for astrophysical investigations but are equally so for laboratory plasma diagnostics and modelling, laser produced plasma investigations, designing and investigations of lasers, for inertial confinement fusion research, plasma technology, plasma devices designing and development and light sources optimization and investigation. In order to provide to scientific community better conditions for the use of theoretical data obtained in Belgrade, the creation of database containing Stark broadening data and other relevant data, is in progress (L. Č. Popović, M. S. Dimitrijević).

Gojko Djurašević published three papers (Djurašević 1998, Djurašević, Demircan, Özdemir, *et al.*, 1998, Djurašević, Zakirov, Hojaev, *et al.* 1998) presenting results of his investigation of close binaries, in collaboration with Turkish (O. Demircan, S. Özdemir, M. Tanrıverdi, Z. Müyesseroglu, H. Ak and B. Albayrak) and Uzbek (M. Zakirov, A. Hojaev, G. Arzumanyants) colleagues. In the first paper (Djurašević 1998), Long-term starspots activity of the eclipsing binary *SV Cam* was analysed in order to determine its orbital and physical parameters on the basis of the interpretation of photometric observations made by Patkós during the period 1973 – 1981. The problem is solved in two stages: by obtaining a synthetic light curve in the case when the parameters of the corresponding Roche model are given *a priori* (direct problem), and by determining the parameters of the model for which the best fit between the synthetic light curve and the observations is achieved (inverse problem). A total of 18 light curves are analysed in the framework of the Roche model, involving two spotted regions on the primary component of the system (Sp G3 V), with the temperature contrast between the spotted area and the surrounding photosphere $A_s = T_s/T_1 = 0.65$. The basic parameters of the system and of the spotted areas are estimated.

In the second paper (Djurašević, Demircan, Özdemir, *et al.*, 1998), the UBV observations of the massive binary *BF Aur*, made at the Ankara University Observatory during 1988, 1989 and 1996, have been used for a photometric study of this early-type binary. The asymmetry of the light curves, arising from unequal height of successive

maxima, indicates that the system is active. By analysing these observations in the framework of the Roche model (including the presence of bright regions on the components) one obtains a semidetached configuration of the system, with the cooler secondary component filling its Roche lobe. Authors assumed that at the place where the gas stream from the secondary falls on the primary, relatively small in size but a high temperature contrast active hot-spot (hs) region is formed. As a result of the heating effect caused by the irradiation of the hot-spot region, on the secondary's side facing the hot spot a bright-spot (bs) region is formed. The bright-spot region is larger in size but with significantly lower temperature than the hot spot. This region can be treated as a "reflection cap". By analysing the light curves in the framework of this working hypothesis the basic parameters of the system and the active regions are estimated.

In Djurašević, Zakirov, Hojaev, *et al.* (1998), results of analysis of the activity of the eclipsing binary WZ Cep, based on the interpretation of its photometric observations, have been presented. The B and V light curves obtained by Hoffmann, as well as the new ones obtained at the Maidanak Observatory in the B, V and R passbands during 1995, are analysed and discussed. These two groups of light curves show large differences in their shape and in the depth of the primary minimum. Hoffmann's light curves show big asymmetry, especially conspicuous in the different height of the successive maxima. The new observations give light curves that are almost symmetric having significantly shallower primary minimum. These light curves have been analysed in the framework of the Roche computer model by applying the inverse problem method. The model is generalised for the case of an overcontact configuration also. To explain these light curves asymmetries and variations, the model involved spotted regions on the components. The analysis shows that WZ Cep system is in a slight overcontact configuration and that best fitting is achieved with spotted regions on the primary star (Sp F5), with the temperature contrast between the spotted area and the surrounding photosphere being $A_s = T_s/T_1 \sim 0.70$. The mass ratio was estimated at the value $q = m_2/m_1 \sim 0.33$, based on the light-curve analysis. The obtained solutions show that there are no significant variations of the system's basic parameters estimated by analysing two groups of very different light curves. Consequently, the main variations in the light curves can be explained by the change of the position and the size of the spotted areas on the primary.

Darko Jevremović with C. J. Butler (Armagh Observatory, Northern Ireland), S. A. Drake (Goddard Space Flight Center, USA) D. O'Donoghue and F. van Wyk from the South African Astronomical Observatory (South Africa), presented simultaneous ultraviolet and optical observations of five flares on the very late type M dwarf Gl 866 (dM5.5e) (Jevremović *et al.* 1998). In this study, a procedure to estimate the physical parameters of the flaring plasma has been developed by using a simplified model of the flare and a comparison of observed and computed Balmer decrements. With the developed procedure they have determined the optical thickness, electron temperature and electron density of the flaring plasma at flare maximum, for three spectroscopically observed flares. They found that these three flares cover up to 5 percent of the stellar surface and have areas similar to solar flares.

As a beginning of an ongoing program of theoretical investigation of the recombina-

tion emission of cosmologically distributed gas, Milan Ćirković and Srdjan Samurović (1998) present a simple analytical model for treatment of recombination lines originating in such medium. Even a cursory glance at the literature reveals that this is a topic of great interest for modern astrophysics and cosmology. The major motivation for such investigations is the possibility of directly detecting optical counterparts to the QSO absorption line systems, whose properties and origin remain one of the most remarkable mysteries in the entire science to this day, when account is taken of the fact that most of baryons in the universe at epoch corresponding to $z \sim 3$ were located within these objects. The targets discussed in this work are mainly galactic haloes at large $\sim 10^2$ kpc galactocentric distances, but also the "true" intergalactic clouds, if they are in equilibrium with the metagalactic ionizing background. Such objects are ionized to very high degree by the metagalactic ultraviolet power-law background, so that neutral fraction is of the order of $\sim 10^{-5}$, but it still produces strong hydrogen recombination flux which could be detectable on Earth under the favorable circumstances. After this flux is estimated, the authors discuss several related topics, such as the possibility of internal ionizing sources embedded in such clouds, and (for the case of halo clouds) "disk proximity effect", i.e. the influence of leakage of Lyman-continuum photons from the disk of the host galaxy (where they are produced by O and B stars). Finally, several notes on the practical feasibility of such recombination surveys with the best present-day telescopes are given. It is shown that H α observations are the most promising way to follow, at least before the launch of the *New Generation Space Telescope*, planned for the end of the first decade of the new century. It is also shown that the redshift dependence of the expected recombination flux does not conform to a simple power-law, but the detailed discussion of this topic is deferred for a next work in the series.

Three review articles (invited lectures and progress reports of XV and XVII International Symposia on the Physics of ionized gases) appeared in 1998 in books of international publishers. One by Atanacković - Vukmanović and Simonneau (1996) on the solution of the non - LTE transfer problem using the method of iteration factors, the second by Dimitrijević (1995) on semiclassical and approximate methods for Stark - broadening investigations of astrophysical and laboratory spectra, and the third by Vince (1996) on temporal variations of Solar spectral lines. Besides, a review article on coexistence of two plasma phases in Solar and AGN coronas by Kubičela, Arsenijević, Popović, Trajković and Bon (1998), has been published in Serbian Astronomical Journal.

The "Large Refractor", that is ZEISS 65/1055 cm equatorial, has been employed for micrometer and CCD (ST-6) measurements of double and multiple stellar systems. Georgije Popović and Rade Pavlović published results of 71 measurements of 35 double or multiple stellar systems, performed during 1997 and 1998. A new double star (PAV 2, Rade Pavlović) has been discovered.

On the visual telescope of the ASKANIA 13.5/160 cm astrograph, photographic observations have been performed with CCD ST-6 and ST-8 cameras. Vojislava Protić - Benišek and Vladimir Benišek observed 9 comets (46P/Wirtanen; C/1995 O1 Hale-Bopp; C/1997 J1 Mueller; C/1997 J2 Meunier - Dupouy; C/1997 D1 Mueller; C/1997 T1 Utsunomiya; C/1998 H1 Stonehouse; C/1998 M5 Linear; C/1998 K5 Linear) and

six minor planets (1036 Ganymed; 1093 Freda; 4954 Eric; 1998 FX2; 1998 FM5; 1998 MK 30). The results are announced in several IAU Circulars.

The "Small Refractor", i.e. ZEISS 20/302 cm equatorial, has been employed in the planed observations of the radiation flux of the 31 Solar spectral line and the measurements of their equivalent widths. The temperature sensitivity of the Mn 539.47 nm line has been determined by Istvan Vince on the basis of observations of several southern chemisphere stars. The preparations for the 11th August 1999 Solar eclipse observations are being continued.

2. EQUIPMENT AND FACILITIES

Of what has been executed during 1998 at the Belgrade Observatory, including the purchases realized, of particular importance is the following:

- Purchased: a computer Pentium 333 MHz, with 128 Mb of RAM memory and 9.1 Gb of hard disc memory and two high speed modems "Crocus" with 128 Kb per second have been obtained trough the courtesy of the Federal Ministry of Development, Science and Environment Protection of Yugoslavia.
- Purchased: a computer Pentium II 300C, two computers Pentium 166 MHz, a ruter MDS 2509, two high speed modems "Crocus" with 128 Kb per second.
- The tinsmith works and painting, on the dome of the "Large Refractor" pavilion. Painting of the domes of the Solar spectrograph, photovisual refractor "Askania" and Zeiss Astrograph 160/180 mm pavilions.
- White-washing and parquet and floor reparation in the offices of the Main building.
- Continuation of the putting in order of the Library, in the course of which 296 journal volumes have been hard bound.

	Beograd	3 500.00
3.5 Reparation of the motor for dome roof rotation	"RAVNICA"	
	Beograd (M. Stojković).....	20 275.00
3.6 Carpenter works on the partition wall in the Main building	"RAVNICA"	
	Beograd (M. Stojković).....	8 120.00
3.7 Hydroinsulation and white-washing reparations on the " Large Refractor" pavilion, Main building and Solar Spectrograph pavilion	"RAVNICA"	
	Beograd (M. Stojković).....	3 250.00
3.8 Painting of domes of "Large Refractor", Solar Spectrograph, Photovisual refractor "Askania" and "Zeiss" Astrograph 160/180 mm (start of investments)	"RAVNICA"	
	Beograd (M. Stojković).....	14 000.00
3.9 Upgrading of Computer Equipment	"RAVNICA"	
	Beograd (M. Stojković).....	25 619.74
4. Announcements in Newspapers		4 458.61
5. Expences on consumed water		2 554.87
6. Expences on garbage removing		6 167.76
7. Expences on the safeguarding at work		450.00
8. Expences on foreign guests accomodation		14 465.10
9. Expences on Photo services		5 754.00
10. Various petty expences		7 259.42
Total		355 433.37

V EXPENDITURES ON NON PRODUCTIVE SERVICES

1. Job Contracts	96 225.50
2. Expenditures on printing of the Observatory's publications in 1998		
Publication	Printed by:	Amount in dinars
2.1 Serb. Astron. J. No 157	"PORTAL Co" Beograd	12 500.00
2.2 Serb. Astron. J. No 158	"PORTAL Co" Beograd	14 990.00
2.3 Publ. Astron. Obs. Belgrade No 59	"PORTAL Co" Beograd	14 400.00
2.4 Publ. Astron. Obs. Belgrade No 60	"PORTAL Co" Beograd	12 700.00
2.5 Publ. Astron. Obs. Belgrade No 61	"PORTAL Co" Beograd	12 990.00
2.6 Publ. Astron. Obs. Belgrade No 62	"PORTAL Co" Beograd	10 000.00
3. Professional advanced training		
3.1 English courses for the staff	6 707.50
3.2 Lectures of foreign guests	1 950.00
3.3 Registrations fees and accomodation at Conferences in Yugoslavia organized by other institutions	15 450.00
3.4 Ph. Thesis of M. Dačić	11 200.00
4. Expences on photocopying outside the Observatory	3 100.60
5. Expences on lowyer services	7 868.25
Total	220 081.85

VI NONMATERIAL EXPENCES

1. Transport expences on missions	63 094.737
2. Transport to job for staff	54 719.34
3. Meals for staff	117 350.56
4. Binding of 296 volumes in hard cover	KKR "PAŠTRMAC"	17 095.00
5. Expences for meals for 27 guests from Romania, Belarus, Russia, Macedonia and Bulgaria; Conference dinners, reception cocktails, coffe and other expences for conferences organized by Belgrade Observatory, anniversary, 8 th March and New Year celebrations at Observatory	84 524.95
6. Costs of payments transactions	8 169.19
7. Membership fees	4170.00
8. Expenses on Students community services	4 340.30
9. Taxes	3 305.09
	Total	356 769.16

VII EXPENCES ON TAXES AND CONTRIBUTIONS

1. Taxes on the building land	595.96
2. Social insurance contributions charging the employer	286 533.16
	Total	287 129.12

VIII EXPENCES FROM PREVIOUS YEARS

Total 1248.30

GRAND TOTAL (I+II+III+IV+V+VI+VII+VIII) 2 546 796.13

Incomes - Expenditures Difference 1 885.29

6. TV AND RADIO EMISSIONS

1. U proseku jednom mesečno I. Vince učestvuje u radio emisiji "Chip" Novosadske televizije na madjarskom jeziku u redakciji Jožefa Vereša (József Vörös) sa temom "Novosti u astronomskim istraživanjima". "Chip" se emituje svake srede od 17h do 17h 30m na 90.5 MHz i 92.5 MHz.
Once a month on the average, I. Vince participated in radio emission "Chip", of the Novi Sad television in Hungarian language edited by József Vörös. The title is "News in astronomical research". "Chip" is emitted every Wednesday from 17h to 17h 30m on 90.5MHz and 92.5MHz.
2. U toku godine Nataša Stanić učestvovala je u radio - emisijama Program za mlade (ponedeljkom u 10) i Poštovana deco (nedeljom od 13 - 14^h). Obe radio emisije su na prvom programu Radio Beograda. Davala je priloge iz astronomije o nastanku vaspione, crnim rupama, životu zvezda, svome boravku na Krimskoj astrofizičkoj observatoriji, ličnoj inspiraciji za upis na studije astronomije na Matematičkom fakultetu, kvazarima, kao i priča o sudbini našeg univerzuma.

During the year, Nataša Stanić participated in radio emissions within the Program for the young (Monday at 10 o'clock) and Honoured children (Sunday 13 - 14^h). Both radio emissions are on the first program of Radio Belgrade. She has been giving contributions from astronomy on the origin of the universe, on black holes, life of stars, her journey to the Crimean astrophysical observatory, her personal decision to study astronomy at the Mathematical faculty, on quasars, as well as on the final fate of our univers.
