

SPHERICAL TRIGONOMETRY OF RISTA KARLJIKOVIĆ

The book Trigonometry by Rista Karljicković was used as a textbook in secondary schools (gymnasium) between two World wars (1924-1941). The most interesting fact is that the significant part of the book was devoted to spherical trigonometry and its usage in astronomy and geodesy. This part of mathematics does not exist in contemporary teaching of mathematics, neither in secondary schools, nor in university lessons.
