

## **ASTRONOMY AND PSEUDOASTRONOMY NEWS IN DOMESTIC MEDIA**

This paper deals with the analysis of astronomy and pseudoastronomy news in Serbian media. We wanted to research types, content and ways of representation of news which have astronomical phenomena as their subject. Furthermore, we researched pseudoscience news that deal with space and astronomy. It's shown that most of these news come from the same sources and that there are no significant differences between media. Most of them treat astronomy news more as curiosities than educational articles. In most of the cases, the subjects are interesting astronomical phenomena, while sometimes these are sensationalistic news dealing with subjects such as aliens or the end of the world.
