

Tracking and Processing Real-Time Astronomical Transients

Veljko Vujčić and Darko Jevremović

Astronomical Observatory, Volgina 7, 11060 Belgrade, Serbia

Running and upcoming big astronomical surveys offer immediate data access in a sense that a significant astronomical event can be processed in (near) real-time. Events are most frequently organized in data streams and may have a heterogeneous structure, and there is also legacy data which can be cross-matched. We review different "brokers", software tools for analyzing real time astronomical data streams.
